COMPARATIVE EXCITED STATE STUDIES OF SELECTED SPECIES USING QUANTUM MONTE CARLO

JOHN A. W. HARKLESS, *Physcial and Chemical Properties Division, National Institute of Standards and Technology, Gaithersburg, Maryland 20899-8380*; RIAD MANAA, *Lawrence Livermore National Laboratory, Livermore California 94550-9234*; WILIAM A. LESTER, JR., *Department of Chemistry, University of California, Berkeley, Berkeley, California 94720-0001 and Lawrence Berkeley National Laboratory, Berkeley, California 94720-0001*.

Accurate estimates of excited state transition energies of selected molecular and atomic species are calculated using the quantum Monte Carlo method, other *ab initio* techniques, and density functional theory, where applicable. Some details of the different calculations are also discussed, in terms of not only computational expense, but also human expense.
