SURFACE ELECTRON EJECTION BY LASER EXCITED METASTABLES SPECTROSCOPY OF ACETYLENE

R. L. THOM, A. P. MISHRA, and R. W. FIELD, *Department of Chemistry and G. R. Harrison Spectroscopy Laboratory, Massachusetts Institute of Technology, Cambridge, MA 02139*.

We report recent progress in attempts to observe rotationally resolved spectra of directly laser-excited vibrational levels of the third triplet excited electronic state (T_3) of acetylene, detected via Auger electron ejection from a gold metal surface. Preliminary results obtained with narrow linewidth (0.005 cm^{-1}) excitation using a frequency-doubled pulse-amplified cw ring laser system will be displayed. Insights into singlet-triplet interaction in acetylene gained from such high-resolution simultaneous laser-induced fluorescence and surface electron ejection by laser excited metastables spectroscopy will be discussed.
