INFRARED DIODE LASER SPECTROSCOPY OF FUNDAMENTAL AND HOT BANDS OF BBr ($X^1\Sigma^+$)

N. T. HUNT, W. Y. FAN, Z. LIU and P. B. DAVIES, *Department of Chemistry, Uiversity of Cambridge, Cambridge CB2 1EW, UK*.

Infrared absorption spectra of ^{11}B^{79}Br, ^{11}B^{81}Br, ^{10}B^{79}Br and ^{10}B^{81}Br have been observed between 650 and 720 cm^{-1} in a BBr$_3$/He ac discharge using diode laser spectroscopy. Over 200 lines consisting of both fundamental and hot bands up to $v'' = 5$ have been fitted to Dunham expansions. The fitted parameters are used to derive the vibrational constants of ^{11}B^{79}Br, $\omega_e = 685.1844(17)$ cm^{-1} and $\omega_e x_e = 3.7347(11)$ cm^{-1}. The equilibrium dissociation energy is also obtained from expanded Dunham-Morse potential, $D_e = 32647(49)$ cm^{-1}.
