The Stark spectra of several methanol isotopomers (CH$_3$OD, $^{13}$CD$_2$OH, CD$_2$OH, and CD$_3$OD) have been investigated in the far-infrared region using the HCN and DCN lasers. The spectra were recorded at room temperature for both parallel and perpendicular polarizations using electric fields up to 60 000 V/cm. Numerous transitions have been observed with these laser lines for all isotopomers. The following transitions will be presented: for CH$_3$OD, $J_K = 6_4 \leftarrow 5_3 E_2 \nu_k = 0$, $J_K = 18_1 \leftarrow 18_0 E_2 \nu_k = 1$, $J_K = 14_6 \leftarrow 13_5 A \nu_k = 1$; for $^{13}$CD$_2$OH, $J_K = 18_2 \leftarrow 17_1 A^- \nu_k = 0$; and for CD$_2$OH, $J_K = 14_1 \leftarrow 15_0 E_2 \nu_k = 1$.

Analysis of the recently recorded FTFIR spectra for CD$_3$OD has yielded accurate zero-field frequencies belonging to the Q-branch multiplet for $K = 11 \leftarrow 10 E_2 \nu_k = 0$. By combining these results with the previously reported Stark fields for the $J = 11$ through 19 members, we have determined the electric dipole moment of this important molecular species for the first time.
