

THE INFRARED EMISSION SPECTRUM OF DCl

TREANA PAREKUNNEL, TSUYOSHI HIRAO, PINA COLARUSSO, ROBERT J. LE ROY and PETER F. BERNATH, *Department of Chemistry, University of Waterloo, Waterloo, Ontario N2L 3G1.*

The vibrational rotational emission spectrum of DCl was recorded with a Fourier transform spectrometer; line positions for the 1-0, 2-1, 3-2 and 4-3 bands of D³⁵Cl and the 1-0, 2-1 and 3-2 bands of D³⁷Cl were measured. The two sets of data were combined with previously measured submillimeter wave pure rotational transitions to obtain Dunham constants. A combined isotopomer analysis of data for all four isotopic forms of HCl was also performed combining these new data with analogous literature results for H³⁵Cl and H³⁷Cl, to yield Born-Oppenheimer breakdown correction terms for this system. The results of similar analyses of HF and HBr allowed a comparison of Born-Oppenheimer breakdown correction terms for HF, HCl and HBr.
