# QUANTUM MONTE CARLO CALCULATION OF SELECTED PROPERTIES OF PROPARGYL RADICAL AND OTHER HYDROCARBON SYSTEMS.

JOHN A. W. HARKLESS, WILLIAM A. LESTER, JR., *Chemical Sciences Division, Lawrence Berkeley National Laboratory and Department of Chemistry, University of California, Berkeley, CA 94720-1460*.

We apply the quantum Monte Carlo method with effective core potentials to the propargyl radical, $C_3H_3$, and its cation and anion. Properties computed and compared with other theoretical and experimental results include heats of formation, electron affinity, and ionization potential. The study of $C_3H_3$ is important in understanding soot formation in hydrocarbon flames. Other systems that will be discussed are acetylene and ethylene. Binding/atomization energies for the latter systems are found to compare very favorably with experiment.
