

SOLID N₂ SURFACE STUDIES, FUNDAMENTAL AND FIRST OVERTONE REGIONS

ROBERT L. HAWKINS and STEVEN M. MILLER, *Air Force Research Laboratory/Space Vehicles Directorate, 29 Randolph Road, Hanscom AFB, MA 01731-3010.*

Infrared emission spectra of N₂, frozen onto a Cu plate at 10K, were obtained in the N₂ fundamental region near 5 μm , and in the first overtone region near 2.6 μm , at 0.003 μm resolution. The solid N₂ was excited by N₂ gas passed through the microwave discharge of the COCHISE (COld CHEmical Infrared Simulation Experiment) reaction cell, and the emissions were measured by a cryogenic monochromator. Spectra were obtained for various mole fractions of N₂ in Ar in the discharge flow. Counterflows of non-excited N₂ or Ar were also investigated. Lines of the 1-0 and 2-0 bands, and in some spectra the 3-1 band, were identified. In addition, ground state vibrational excitation up to the A-state energetic limit was observed. The dependence of these spectra on the composition of the discharge flow and the counterflow will be discussed.
