

RYDBERG STATES OF BORON HYDRIDE RADICALS BH AND BH<sub>2</sub>.

JASON CLARK, HARTMUT G. HEDDERICH and EDWARD R. GRANT, *Department of Chemistry, Purdue University, West Lafayette, IN 47907-1393.*

Ionization detected absorption spectra of Rydberg states for BH and BH<sub>2</sub> will be reported. Boron hydride radicals are produced by ArF (193 nm) photolysis of B<sub>2</sub>H<sub>6</sub> (diborane) in a supersonic pulsed-jet. Ions produced by Resonance-Enhanced Multiphoton Ionization are mass selected and detected using a time-of-flight mass spectrometer. Various Rydberg states appearing as resonant features between 370 and 500 nm will be discussed.
