PLEGATE, AND TERRY A. MILLER, *The Ohio State University, Dept. of Chemistry, Laser Spectroscopy
Facility, 120 W. 18th Avenue, Columbus, Ohio 43210.*

Recently we have obtained vibronically resolved spectra of some moderately large alkoxy radicals, including 1-propoxy, isopropoxy, 1-butoxy, 2-butoxy, and *t*-butoxy. The species were produced in the jet by XeF photolysis of the appropriate alkynitrite. This work represents the first jet-cooled spectra of the butoxy species; previous excitation spectra of the larger alkoxies have been limited to only a couple of flow cell experiments.^{a,b} A parallel effort has generated good quality *ab initio* calculations for the alkoxy radicals to aid in the spectral analyses. The vibronic structure and analysis will be discussed including comparisons with the previous cell experiments. The present experiments are preliminary to ones that will obtain higher resolution, rotationally resolved spectra.
