

POLARIZATION QUAMTUM BEAT SPECTROSCOPY OF NO₂: HYPERFINE LEVEL STRUCTURE IN THE YEL-LOW REGION(16000-19250 CM⁻¹)

JU XIN AND SCOTT A. REID, *Department of Chemistry, Marquette University, Milwaukee, WI 53201-1881.*

We report on the application of fluorescence-based polarization quantum beat spectroscopy to probe the excited hyperfine level structure of NO₂ vibronic bands in the yellow region (16000-19250 cm⁻¹). Two general trends are observed when comparing our results with spectroscopic studies at lower energy. First, fluctuations in the Fermi-contact interaction dampen with increasing energy. Second, the magnitude of this interaction decreases with increasing enegy. We will discuss possible explanations for and implication of these trends.
