COUPLED CLUSTER CALCULATIONS FOR COMPLEXES BETWEEN AN ARGON ATOM AND A LINEAR MOLECULE OR CATION

PETER BOTSCHWINA and RAINER OSWALD, Institut für Physikalische Chemie, Universität Göttingen, Tammanstraße 6, D-37077 Göttingen, Germany.

Geometric structures and various spectroscopic properties were calculated by the coupled cluster variant CCSD(T) for a number of complexes between an argon atom and linear neutral molecules (HCCH, HC₂N and HC₄H) and cations (HCNH⁺, HCCH⁺, HC₃NH⁺ and HC₄H⁺). The electronic ground state of Ar·HCCH⁺ has ^2A₁ symmetry with a T shaped equilibrium structure. The linear form of Ar·HC₄H⁺ is energetically favoured over the T form, while the opposite holds for the corresponding neutral complex.
