

## STRONG FLUORESCENCE IN A DERIVATIVE OF 2-OXAZOLIN- 5 ONES

V.B. SINGH, *Department of Physics, Udai Pratap Autonomous College, Varanasi-221002*; D.K. RAI, *Department of Physics, Banaras Hindu University, Varanasi-221005*.

The 2-phenyl-4-(4-methoxy benzylidene)-2-oxazolin-5-one, an important class of heterocyclic organic molecule, shows strong fluorescence in the ethyl alcohol solution with the excitation of 476.5 nm, 488 nm, 496 nm and 514.5 nm lines of 10 W Ar<sup>+</sup>-ion Laser. The photoacoustic spectra and UV-VIS absorption spectra of this organic derivative indicate that the above fluorescence was observed due to singlet-triplet transition. The fluorescence peaks observed at different power and excitation wavelengths indicate the probable laser emission in the above organic derivative.
