ECI DL SPECTRUM OF $^{15}$NH$_3$ IN THE 6370-6580 CM$^{-1}$ REGION OF THE $\nu_1 + \nu_3$ NH-STRETCHING COMBINATION BAND

R.M. LEES, Department of Physical Sciences, University of New Brunswick, Saint John, NB, Canada E2L 4L5.

The infrared spectrum of the N-15 isotopic species of ammonia is being investigated in the 6370-6580 cm$^{-1}$ region with an external cavity tunable diode laser spectrometer. The patterns of some of the stronger absorption lines are very similar to those known for the $\nu_1 + \nu_3$ N-H stretching combination band of normal $^{14}$NH$_3$, permitting immediate assignment by analogy with the known N-14 transitions. For $^{15}$NH$_3$, the $\nu_1 + \nu_3$ band origin is shifted downwards by 12.2 cm$^{-1}$ relative to $^{14}$NH$_3$. From the preliminary spectra, the absorption intensities appear fairly comparable for both species, but more careful measurements to better define the isotopic intensity ratio are underway.
