of Sydney, NSW 2006, Australia.*

The $d^3\Pi_g - c^3\Sigma_u^+$ system of dicarbon was observed in a discharged supersonic jet of C_2H_2 .^a A spectral survey was carried out based on the result of high-level *ab initio* calculation.^b LIF excitation spectra of the band system were recorded by detecting fluorescence of the Swan system ($d^3\Pi_g - a^3\Pi_u$). Several molecular constants of the $c^3\Sigma_u^+$ state were experimentally determined from the rotationally resolved spectra. Characterization of the $c^3\Sigma_u^+$ state of C_2 is of importance to astrophysical models of the species.
