

## LOW-ENERGY PHOTOELECTRON IMAGING SPECTROSCOPY OF ANIONS

CHRISTOPHER L. ADAMS, and J. MATHIAS WEBER, *JILA, NIST, and Department of Chemistry and Biochemistry, University of Colorado, Boulder, Colorado 80309, USA*; KENT M. ERVIN, *Department of Chemistry, University of Nevada, Reno, 1664 N. Virginia St. MS 216, Reno, NV 89557-0216*.

We report on photoelectron emission from nitroalkane anions using low-energy velocity map photoelectron imaging. The excess electron of these radical anions is weakly bound with adiabatic electronic affinities around  $1500\text{ cm}^{-1}$  with relatively benign sensitivities to the length of the alkane chain. In addition to conventional photoelectron spectroscopy, we use vibrational excitation of the CH stretching vibration ( $2700\text{-}3000\text{ cm}^{-1}$ ) to induce vibrational autodetachment. We have obtained an improved value for the adiabatic electron affinity ( $172 \pm 6\text{ meV}$ ), and definitively assigned the vibrational features in the photoelectron spectrum of the nitromethane anion. In addition, the vibrational autodetachment spectrum offers insight into vibrational modes involved in vibrational autodetachment.
