

STUDYING THE STEREOCHEMISTRY OF NAPROXEN USING ROTATIONALLY RESOLVED ELECTRONIC SPECTROSCOPY.^a

JUSTIN W. YOUNG, LEONARDO ALVAREZ-VALTIERRA, and DAVID W. PRATT, *Department of Chemistry, University of Pittsburgh, PA 15260.*

Many biochemical processes are stereospecific. An example is the physiological response to a drug that depends on its enantiomeric form. Naproxen is a drug which shows this stereo-specific physiological response. To better understand the stereo specificity of chiral substances, we observed the $S_1 \leftarrow S_0$ transitions of R- and S-naproxen in the gas phase using rotationally resolved electronic spectroscopy. The results will be discussed.
